Episode 1

This App Skips Login Screen

A JavaFX walkthrough of the Clash of Clans project

Trace main() → launch() → start() — then fix the entry point.

≈8 min • For Java developers who is new to JavaFX

The problem

The app skips its own login screen

```
src/com/coc/GUI.java
start(Stage stage) {
  LoadData playerData = new LoadData();
  Player player = new LogInController(...).getPlayer("", "");
  new PlayerPanel(player, ...).start(new Stage());
}
```

0

screens shown

1

fabricated Player

0

logins required

The entry point

GUI.java: main() → launch() → start()

```
package com.coc;
import controller.LogInController;
import javafx.application.Application;
import javafx.stage.Stage;
public class GUI extends Application {
  public static void main(String[] args) { launch(); }
  @Override
  public void start(Stage stage) {
    LoadData playerData = new LoadData();
    Player player = new LogInController(playerData.getPlayers()).getPlayer("", "");
    new PlayerPanel(player, playerData.getPlayers()).start(new Stage());
  }
}
```

Concepts this episode:

- Application
- launch()
- Stage / Scene (first sight)
- JavaFX app lifecycle

Why module-info needs javafx.controls

The bug

getPlayer("", "") invents a player

```
public Player getPlayer(String idPlayer, String password) {
  for (Player player : players) {
    if (player.getIdPlayer().equals(idPlayer) &&
      player.getPassword().equals(password)) {
      return player;
    }
  }
  return new Player(new MapLoader(4, "map4"), "", ""); //throw new
    Exception("username or password is wrong!");
}
```

`src/controller/LogInController.java:21`

The module path

Running the app: module-info.java

```
module com.coc {
  requires javafx.controls;
  requires javafx.fxml;
  requires javafx.media;
  requires javafx.base;
  requires javafx.graphics;
  requires assets;
  requires org.yaml.snakeyaml;
  requires cr0s.javara.main;
}
```

src/module-info.java

What you see on screen

- module-info.java
- build.xml run target
- classpath vs module path

The fix

The LogIn Page

```
public void start(Stage stage) {
  LoadData playerData = new LoadData();
  new LogIn(playerData.getPlayers()).start(stage);
}
```

Verify:

- App opens on LogIn
- PlayerPanel only after login
- App still runnable

Live demo

Before → after

Before: launch → PlayerPanel (no login shown).

After: launch → LogIn → (on success) PlayerPanel.

On-screen beats this episode:

1. Run the app — observe it lands on PlayerPanel, without LogIn.
2. Inspect LogInController.getPlayer("", "") — fabricated Player at line 21.
3. Walk module-info.java — read the requires lines.
4. Edit GUI.java — redirect entry point to LogIn.
5. Run again — confirm it now opens on LogIn.

Every Screen Is Its Own Application
